

Assignment 2. Advanced CSS: Flexbox & Grid

Team Name: KFC Bosses **Group:** SE-2510 **Topic:** KFC Kazakhstan Project

1. Team Members & Roles

- **Zharkyn Akhmetov**
 - **Role:** Idea creator & JS/CSS stylist, HTML developer
 - **Pages Created:** index.html, menu.html, gallery.html
- **Khantore Orynbassar**
 - **Role:** Executive Chef & HTML/CSS Lead Developer
 - **Pages Created:** schedule.html, contacts.html, gallery.html
- **Alnur Bakbergenov**
 - **Role:** True Boss & HTML/CSS Assistant Developer.
 - **Pages Created:** promos.html, about.html, gallery.html

2. Objective

The objective of Assignment #2 was to apply advanced CSS layout techniques using Flexbox and CSS Grid. The goal was to create responsive layouts without using external UI frameworks, while improving alignment, spacing, component design, and user experience.

3. Step-by-Step Description of Tasks

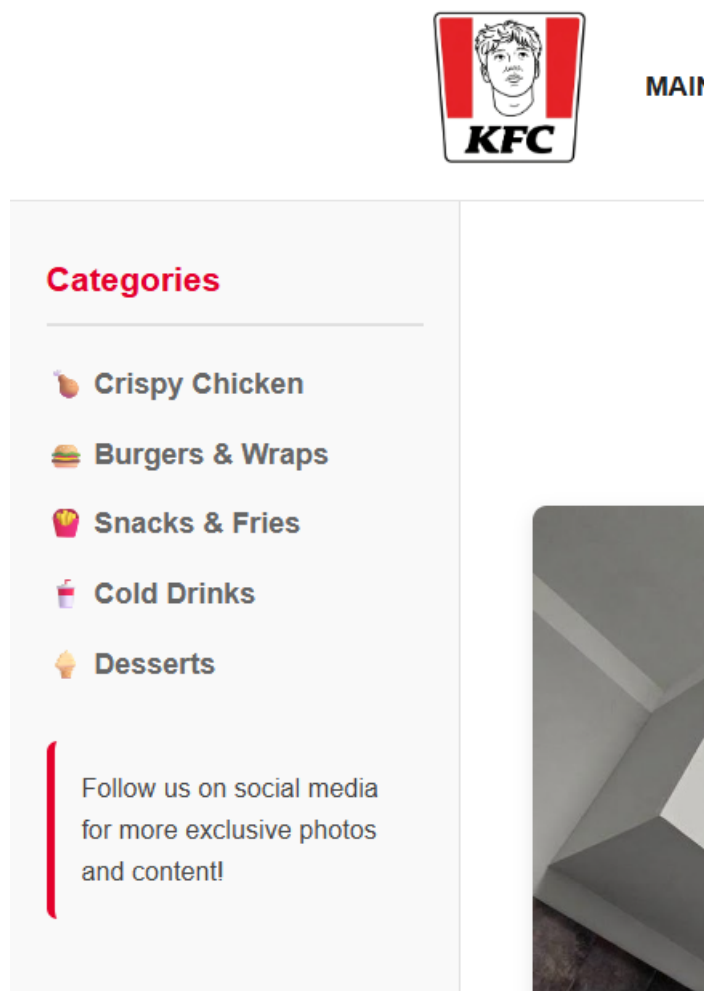

Part 1: Flexbox Layout

- **Step 1:** Created a flexible navigation bar using `display: flex` to align the KFC logo and navigation links horizontally. We used `justify-content`, `align-items`, and `gap` to control the spacing and alignment of the navigation elements.
- **Step 2:** Developed a responsive promotional card row using Flexbox. The `.promo-grid` container uses `display: flex`, `justify-content: center`, `gap`, and `flex-wrap` to arrange multiple promotion cards while allowing them to move to a new line on smaller screens.
- **Step 3:** Styled individual `.promo-card` elements using Flexbox with `flex-direction: column` and `justify-content: space-between`. This keeps the content and buttons properly aligned inside cards with the same visual structure.
- **Step 4:** Added interactive hover effects to the promotional cards. The cards use `transform: translateY()` and `box-shadow` with CSS transition to create a smooth lifting animation when the user moves the cursor over a card.

Part 2: CSS Grid Layout

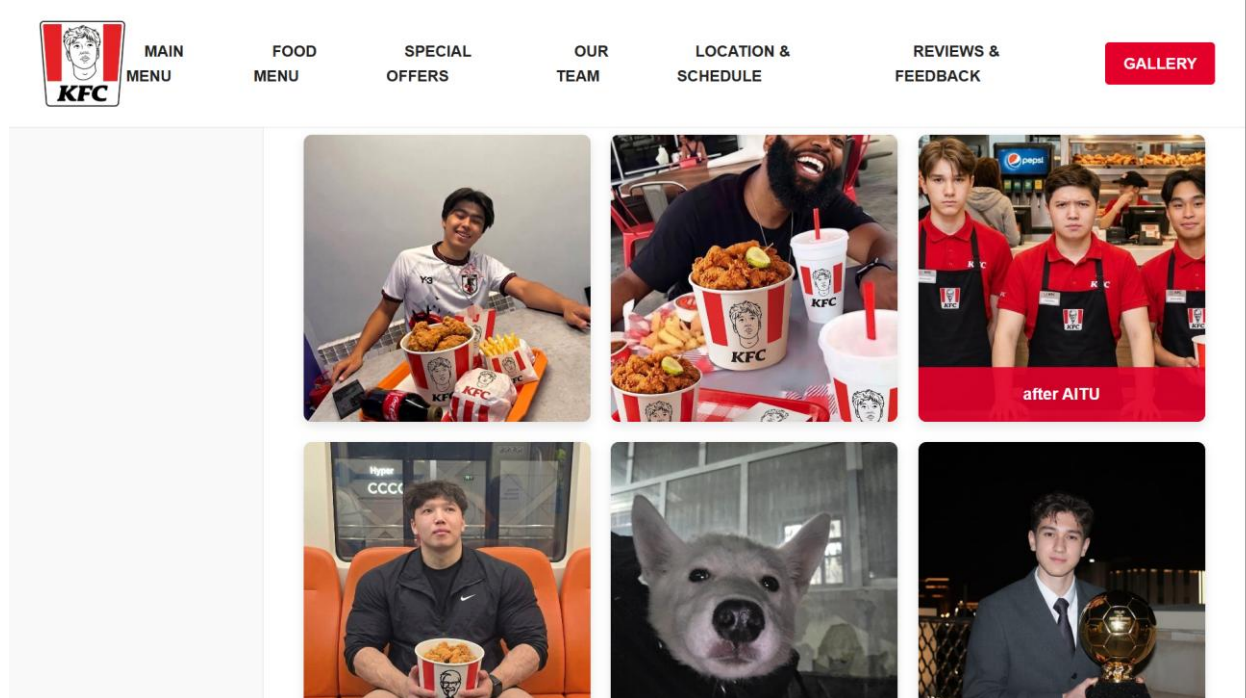

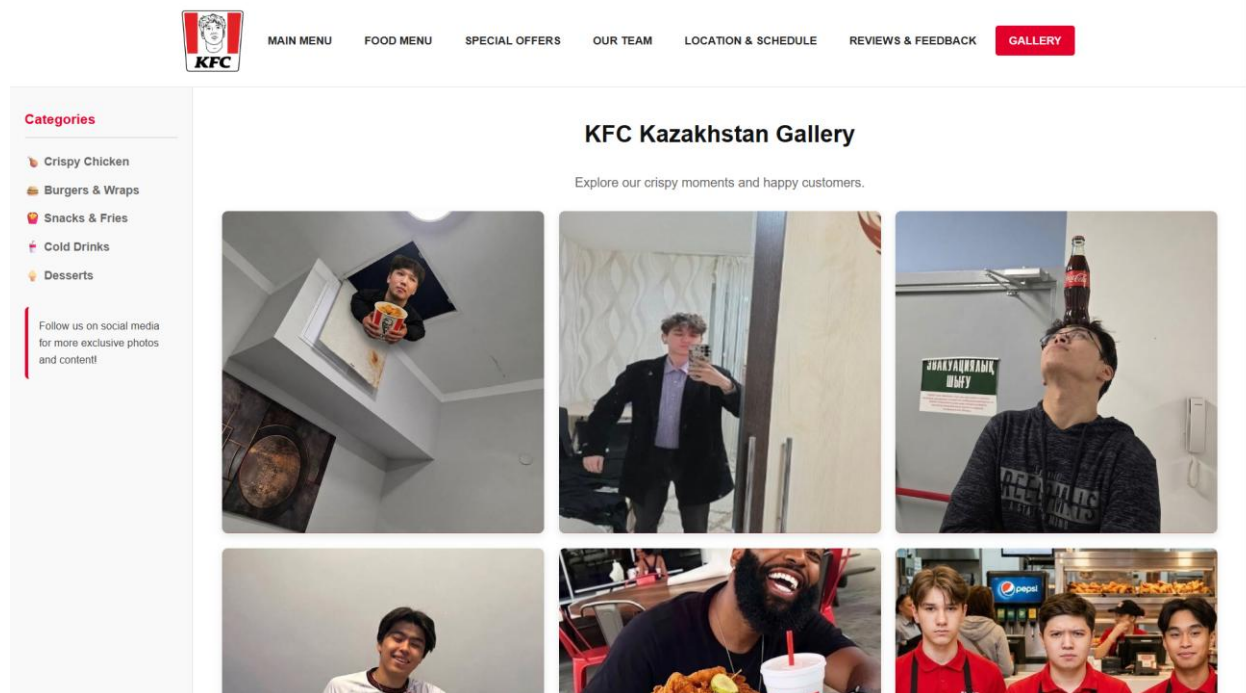

- **Step 5:** Created a dedicated Gallery page using CSS Grid. The main page wrapper uses `display: grid` with three rows and two columns to organize the header, sidebar, main content, and footer.
- **Step 6:** Implemented named Grid Areas using `grid-template-areas`. The layout contains separate "header", "sidebar", "main", and "footer" areas, which makes the page structure clear and easy to manage.
- **Step 7:** Developed a nine-image gallery using CSS Grid. The `.gallery-grid` uses `grid-template-columns: repeat(3, 1fr)` and `gap` to create an organized three-column layout with equal-sized gallery items.
- **Step 8:** Added visual effects to the gallery images. Each image uses `object-fit: cover`, while the hover effect applies `transform: scale(1.1)` to create a smooth zoom animation. Captions appear from the bottom when the user hovers over an image.

Part 3: Responsive Design

- **Step 9:** Added responsive behavior using the CSS `@media` rule. When the screen width becomes smaller than 768px, the Grid page changes from a two-column layout to a single-column layout.
- **Step 10:** Modified the gallery layout for smaller screens using `auto-fit` and `minmax()`. This allows the gallery columns to automatically adjust according to the available screen width.
- **Step 11:** Combined Flexbox and Grid throughout the project to create layouts that remain organized on different screen sizes. Flexbox was mainly used for navigation and card

arrangements, while Grid was used for the main Gallery page structure and image gallery.

Part 4: Final Styling and Testing

- **Step 12:** Tested the interactive effects and responsive behavior of the website. We checked the navigation, promotional cards, gallery hover effects, Grid areas, and mobile layout to make sure the elements remained functional and visually consistent.
- **Step 13:** Reviewed the final website and verified that the Advanced CSS requirements were implemented, including Flexbox navigation, Flexbox cards with hover effects, CSS Grid page layout with named areas, a nine-image Grid gallery, and responsive design.
